How to learn any skill? A complete guide.

Our perception of learning a new skill

While considering learning a new skill we often are, firstly, very excited, and then after a little effort, we get tired and lose interest.

Learning a new skill, for us, is like winning a lottery overwhelming but with a little chance of achieving it. In the case of learning any skill, you don't need luck or a high IQ. All you need is motivation, passion, and consistent hard work to become a master of it.

Steps to follow

Motivation

Learning is a skill itself. And this skill too can be improved. You can learn anything if you follow certain steps. Firstly, there should be a solid motivation for learning a new skill. A few are listed below:

- For promotion at work.
- To switch field.
- For mental growth.

Believe in yourself

After getting motivation the most important thing is to believe in yourself. For ages, people have believed that skill is highly associated with talent. That is, either you can sing or you cannot sing. Either you own skill by birth or you don't in your lifetime. But recent research has shown that talent is determined by our actions rather than our genes.

So before start learning any skill believe in yourself that you can not only learn it but also can master it.

Selecting a skill

Nowadays there is a long list of skills available that you can learn. However, this doesn't mean that you should drain your energy in learning every one of them. The third step in learning a skill is being very precise in selecting the skill itself.

The skill you pick must have two things

1. You're passionate about it.
2. It should help you in setting up a career for life or it should solve your problem.

If it doesn't fall in any of these, you will lose interest and have difficulty in learning it.

Practice

The best way to learn a skill is to perform it physically. Humans learn faster when they go through tasks over and over. If you're learning a language practice as much as you can. Try building up new sentences of your own. Similarly, for every skill, practice is the best way to learn it fast.

Set goal and deadlines

Initially, set up small goals for your progress check. Make sure you do better every time. Try setting up easy targets in the beginning and make them harder as you improve your skill. Also, along with the goals set up deadlines too.

Study the masters

To be an inspirational writer, one needs to do a lot of reading. Studying greats is passive learning but to gain from it one needs to practice all that is learned. Finally, to further master your skill teach. Teach the skills you have learned to find out the areas of weakness and improvement. Teaching others will help you learn faster than you think.

How to write a blog post? For beginners.

Anybody can write a blog post or an article after following a few simple steps. There is a basic pattern to follow to write an interactive and interesting blog post.

Following are the steps:

Research

After selecting the title of the blog post, research is the first and the most important part of writing a blog post. The basic purpose of the research is to gather information about the topic. Now, for research, you must align things up. There are further three steps in the research process

Gather information

Gathering information is the most important work in the research process. You will gather a bulk of information about the topic. This can be done easily with the help of an information hub i.e. Google. Collect all the information, you think, you need about your topic.

Add references

The second part of the research process is to find references/sites/articles that back your point of view. This step is important as it makes your blog post more authentic and well researched.

Add facts and stats

Stats are credibility boosters for your blog post. If you collect and later on add them appropriately they will help you enhance the validity of your blog post.

Reading

If you are writing for a firm or a client it is fairly possible that you will not know about every topic. Considering the worst-case scenario, let's say you do not have even a little knowledge about the topic you have to write a blog post about. So the first thing you will do, after research, is read. If you read at least 5 articles about a particular topic you will have information more than a common man.

Arranging the information

Now pick all the information that, you think, is useful and make bullet points and construct a structure for your blog post. Do not hesitate in gathering any kind of information even if it feels unworthy because it can make sense and find a perfect place. Extracting useful information from all the information that you have collected from the research process is the next step.

Rewriting

After you have structured your blog post and have made important points now is the time to rewrite the whole article in your own words. The content that you have picked from the research is your reference material. You can use it to elaborate on your point of view. While writing a blog post make sure that the length of a paragraph is suitable for the reader. It should not be too lengthy or too short that it contains only one or two sentences. Sentences should also be on point and accurate in length. Further, you can add references to previously done studies and experiments related to your topic.

For SEO

- It is recommended that the keyword of your article/blog post must be used in each of the subheadings at least once.
- Avoid keyword stuffing. The density of the keyword should be around 1%
- You can use keywords in different related forms throughout your blog post to create relevance.

I have worked on this website as a content writer. I have written 2 blogs for the sites. These are the links:
